

PRESS RELEASE

Carry Life™ - a revolutionary integrated wearable dialysis system is introduced at ERA/EDTA Conference in London, May 28, 2015.

The highly innovative Carry Life™ dialysis system enables freedom of mobility during therapy. At the size of a shoebox the convenient Carry Life™ device is a complete integrated system. It is provided in two different versions, for continuous peritoneal dialysis or peritoneal ultrafiltration respectively. This makes it suitable for renal failure patients as well as heart failure patients.

Developed and manufactured by the Swedish medical engineering company Triomed, Carry Life™ is the result of ten years of research and development, supported by world renowned medical expertise and specialist engineers. Triomed started with extracorporeal regeneration of dialysis in 2005 and continued with extracorporeal treatment of heart failure in 2013.

By enabling mobility and freedom from restricted lifestyle, Carry Life enhances quality of life for CARDIAC and RENAL patients, says Anders Wallenås, CEO.
